In the following sections, we explain many of Photoshop's most popular functions. Applying Photoshop's editing tools Photoshop has six basic editing tools: Brush: Handles the black-and-white paintbrush tools, such as the paint bucket and airbrush. Lasso: The marquee tool is the most well-known of Photoshop's tools. It's a fine line that you draw around an object that you want to select. The area covered by the line is then automatically selected. Magic Wand: You can use the magic wand tool to select objects that are similar in color. The magic wand tool works much like the lasso tool, but it's also a selection tool. You use the wand to draw the selection line. Pen: The pen tool enables you to draw using a vector-based line, making it ideal for freehand painting and editing. Pencil: You can do many things with this tool, such as draw straight, curly, and even wavy lines. Airbrush: You use this tool to paint over an image. It's ideal for image correction and retouching or painting in color over an image. With each of these tools, the tool controls the area affected. For example, the brush controls the area that is brushed, the magic wand selects objects only, the pen draws a vector-based line, and the lasso tool can draw a selection as well as select the area. Adjusting your workspace The workspace is your Photoshop editing surface. You interact with your image and manipulate it when you're working in the workspace. (See Figure 3-1.) **Figure 3-1:** The workspace is the place where you work in Photoshop. You can work in a variety of window and Photoshop workspace combinations, allowing you to customize your editing and workflow to your specific need. Starting with the window settings The most common window setting is the standard view, which is represented by the large central window with Photoshop's toolbar in the bottom center of the screen. When you're working in a standard view, your image is open in the center of the screen. All the layers in your file are open in the Layers panel. You can use the Layer and File menus to change the order of the layers (see Figure 3-2). **Figure 3-2:** The standard view is the default window setting and includes the Layers panel and the tools

An Encoding Parameter is an Image Coefficient that projects a image of the best quality on your computer screen. It can be adjusted in special ways. This is why it is actually a setup process, not just a single number. Understanding the Image Coefficient – An encoding parameter is a bit like an ad hoc setting. It is similar to the thing that makes you smile; the way you are attracted to certain things; or your desire to "go for it". This is important; because when you add all the parameters together – your encoding parameter (or better still, the value of one of the parameters) is what makes the difference between a great image and a "just okay" image! Here is how it works: The image is digitally captured by your camera. The digital camera captures the light which is reflected by the object you want to photograph. This light is converted into electrons by the CCD (charge-coupled device) chip. These electrons are "pixels" that can be added up. By choosing a colour space like the sRGB or Adobe RGB colour space, we choose the system where the camera will display pixels in. Every pixel has its own colour – the more colours the pixel has, the more detail it contains. The less colours a pixel has, the less detail it contains. This is why your camera has to be able to display colours in a particular space. It would not make sense for the camera to make huge pixels in one colour space and tiny pixels in another colour space; as it would not display detail. The same principle applies to computers. If you click on the CUE button (colour encoding) in Photoshop, you see the picture in the LAB (like a colour wheel) colour space. It is important that the pixel shapes and colour ranges match those of your monitor. The software does not know or care what technology is inside your monitor, other than that it should have many colours and that the hue should match with the ones in the image. If the colours do not match, the image will look dark or white. If the image has more colours than your monitor can display, the colours will be magenta or yellow; or white. The reason we use the Adobe RGB colour space is that it is considered as the most accurate colour space on the market. Another thing

Q: How to scrape a list of websites within a given page of webmaster tools from Google webmaster tools? There is a way to scrape some content from Google webmaster tools? I get "GET website_list.php?url= HTTP/1.1" But even if I try with this "GET website_list.php?url= HTTP/1.1" I get the same response. What am I doing wrong? A: From the Meta Keywords found at the bottom of your screenshot: Google Webmaster Tools disallows automated queries, except for the search page and webmaster tools search box. So, the Google Webmaster Tools dont accept queries sent from Robots. A great WordPress.com site Menu To Death And Back "An Indian from a rural community in Pakistan, who had managed to climb up the K2 mountain in the Himalayas, was swept to his death, as his tent collapsed. He was killed in his sleep. A mountain climber from India, Bikash Deka, was found dead on Wednesday morning on the treacherous south ridge of the Himalayan K2, the world's second-highest mountain. The 35-year-old was on the summit of K2 on May 11, when the weather conditions turned and the tent he had set up for the night collapsed. "My father is a renowned mountaineer," Arun Deka, Bikash's elder brother, told IANS. "He had passed away a month ago in the holy city of Varanasi, but we didn't know he was going to climb the treacherous K2." Bikash Deka, who lived in Sadar Baria village, was also a follower of Lord Shiva, the Hindu god of destruction and renovation, Arun said. Bikash was not married and had no children, Arun added. "We do not know the reason for his death," he said. Efforts to contact Bikash's family
