Since the launch of Lightroom 5, images exported with the new workflow certainly feel better than they used to inside the Adobe Bridge, but it is a strange feeling. The familiar workflow feels like I am missing something. Is it the new, more solid and streamlined UI? Or the way the import and export functions work? I will not know until Lightroom 5 comes out of beta and I see what “Pro” upgrade option does. I do expect smart features here, since the initial release of Lightroom did not have everything we needed. And of course, I must clarify my opinion that Lightroom has awesome RAW DNG support, which made all of my post-processing effort worth it in the end. The Lightroom team must get a bonus for that one. Ultimately, I do feel that I have somewhat gotten used to the way things work now in Lightroom, and I am content with the way most of the new features in Lightroom 5 were implemented, especially when it comes to non-destructive editing. Certainly, the extended Spot Removal tool has made a huge difference to how I work with photos, since it is not only quick, but also enables me to edit with greater specificity. Also, an image can be saved with any changes you’ve made. It feels like never testing a photo again. I occasionally do not even delete backups of photos, as I am often able to apply these edits in Lightroom. That said, some issues still require my attention. The right-clicking menu is not as extensive as it has been before. In combination with the non-intuitive, single-click Recent option in the upper left corner, it keeps me from finding sometimes essential actions. I don’t mind the fact that the function keys in the top right are now mapped to functions in the Edit menu instead of undo/redo, but it sure is a huge disadvantage. The lack of useful tools in the Develop module does not make up for this, either. The impressive “Featured Adjustment” module is a side note, really. I also don’t feel that working with presets is as easy as before. I have come to love using presets, but I do miss the ability to apply them directly to an image by pressing a button. I use presets in the Develop module mostly, for specialized conditions or stylistic effects, but a quick press of a button to apply this or that effect would be perfect.

In the classic Adobe Creative Suite, your customizations are stored as a team project. As the name suggests, this effectively means the project is owned by all members of the team — you and your teammates. But if it really is a team project, why do you need to sign-in with a different sign-in each time you visit a project? One of the great things about the Creative Cloud is that you can have your own profile and only login with your account, even if you are part of a team. By combining that with streamlined workflows, you can now have more productive workflows that are more efficient in terms of time, resources, and effort. Like many other designers, you may have heard

the term **bootstrap** used by developers and designers to refer to a typical code architecture involving a grid-based CSS framework, responsive design, clear organization of HTML, and a generous amount of semantic markup. Photoshop users frequently turn to Google for both directions and skills. In an effort to improve that experience, Photoshop is taking a revolutionary step towards artificial intelligence by letting users direct their camera as if they were a virtual assistant. In May, a beta version of this feature was released, but the upcoming update to adobe Photoshop CC will include it as a part of the standard subscription. The experience will be similar to how a Word assistant works for many users. The feature will allow users to have Photoshop Follow Me and Get Info. Users will be able to access the application from anywhere, but will receive localized updates. Interaction will be directed by machine learning and AI. The application will also help find and deliver relevant content for users to improve their workflow. PSD is a file format used to store Adobe Photoshop files.
